

GINGONI Variable flow Distributor

Aquelle 0-11 l/s biofilter

GINGONI VARIABLE FLOW DISTRIBUTOR

OPERATING PRINCIPLE

Generally distributors for biofilters are designed for a constant flow, or at least a constant minimum and constant maximum flow.

Flow is distributed over the media bed evenly, at constant speed and without the use of any power.

The Gingoni variable flow distributor not only achieve above, BUT in addition allow for a varying flow from 0 l/s up to a designed maximum flow.

Thereby negating the need for a pumping system, or remote syphon arrangement
